PROFESSIONAL SUMMARY

AI Product Engineer with 17 months of professional full-stack experience and 3 self-directed Gemini-backed products in production. Builds the complete product path around LLMs: document-grounded retrieval, structured-output validation, contextual recommendation flows, server-side model access, and caching and rate limits that control latency, spend, and key exposure.

TECHNICAL SKILLS

LLM Integration: Google Gemini API, Prompt Engineering, Schema-Constrained Output, Output Validation
Retrieval: Retrieval-Augmented Generation (RAG), Embeddings, Document Chunking, Semantic Search
Serving and Cost Control: Server-Side Model Proxying, API-Key Handling, Redis Response Caching, Rate Limiting
Languages: Python, TypeScript, JavaScript (ES6+), SQL
Backend and Data: FastAPI, Node.js, Express.js, REST APIs, PostgreSQL, MySQL, MongoDB, Supabase, Redis
Cloud and DevOps: Cloudflare Workers, Vercel, Firebase, AWS, Git, GitHub Actions, CI/CD
Practices: Agile/Scrum, Code Review, Root-Cause Analysis, Technical Documentation

PROFESSIONAL EXPERIENCE

Independent AI Product Engineer

May 2025 – Present

Self-directed product work – 0xshiv.dev

Remote

- Shipped 6 production products end to end, 3 of them Gemini-backed, covering retrieval, structured generation, contextual recommendations, server-side model access, and the interfaces around them.
- Owned schema and API design, model-output validation, key handling, caching and rate limits, GitHub Actions CI/CD, and production deployment.

Full Stack Developer, Intern

December 2023 – May 2025

Tedforge Solutions Private Limited

India

- Built REST APIs in Node.js and Express.js and wired them to React and Angular frontends across a 17-month internship, delivering data-driven features against real client requirements.
- Reworked MySQL and MongoDB queries on data-heavy screens to cut round trips and redundant reads, improving perceived responsiveness.
- Took bug reports through reproduction, root-cause analysis, and refactoring rather than surface patches, cutting recurring defects on owned modules by 40%.

PROJECTS

Quizify – Document-Grounded Assessment Platform | [quizify.0xshiv.dev](#) | *Google Gemini, RAG, Embeddings, FastAPI, Redis, Supabase (PostgreSQL)*

- Built an assessment platform that ingests a user's own documentation and generates topic-based quizzes from it on demand, cutting question authoring from minutes to seconds.
- Implemented the retrieval pipeline end to end – chunking source documents, embedding them, and retrieving relevant passages to ground Gemini's question generation so quizzes stay on-topic instead of hallucinating.
- Constrained output to a fixed 4-field schema (question, options, answer, explanation) through prompt design, and passed learner profile data into the prompt to vary difficulty.
- Routed every Gemini call server-side so no key reaches the browser and cached responses in Redis, cutting repeat-topic generation to 0 model calls.

FitTrack AI – Adaptive Fitness Platform | [fittrack.0xshiv.dev](#) | *Google Gemini, Python, Next.js, Supabase (PostgreSQL)*

- Built a fitness platform that unifies 3 log streams – workout, nutrition, and recovery – and adjusts recommended training intensity as that history changes.
- Passed each user's profile and recent performance into the Gemini prompt to produce goal-aware guidance in plain language rather than raw metrics, served through a server-side route.

MoodRadio – Contextual Music Recommendation | [moodradio.0xshiv.dev](#) | *Google Gemini, Next.js, TypeScript, YouTube Data API, Firebase*

- Built a recommendation flow that converts free-form mood descriptions into structured emotional context, then ranks candidate tracks against the listener's YouTube library and recent plays.
- Combined Gemini interpretation with deterministic scoring and history signals so recommendations remain personal while avoiding repeated artists.

EDUCATION

Bachelor of Technology in Computer Science and Engineering

2023

COER University

Roorkee, India

Relevant Coursework: Data Structures and Algorithms, Object-Oriented Programming, Database Management Systems, Operating Systems, Computer Networks, Software Engineering.
